ABSTRACT

Vedic Multiplication Technique is used to implement IEEE 754 Floating point multiplier. The Urdhva-triyak bhyam sutra is used for the multiplication of Mantissa. The underflow and over flow cases are handled. The inputs to the multiplier are provided in IEEE 754, 32 bit format. The multiplier is implemented in Virtex-5 FPGA and VHDL is used.

INTRODUCTION

DSP applications essentially require the multiplication of binary floating point numbers. The IEEE 754 standard provides the format for representation of Binary Floating point numbers [IEEE, 2008; Brian Hickmann et al., 2007]. The Binary Floating point numbers are represented in Single and Double formats. The Single consist of 32 bits and the Double consist of 64 bits. The formats are composed of 3 fields; Sign, Exponent and Mantissa. The Figure 1 shows the structure of Single and Double formats of IEEE 754 standard. In case of Single, the Mantissa is represented in 23 bits and 1bit is added to the MSB for normalization, Exponent is represented in 8 bits which is biased to 127, actually the Exponent is represented in excess 127 bit format and MSB of Single is reserved for Sign bit. When the sign bit is 1 that means the number is negative and when the sign bit is 0 that means the number is positive. In 64 bits format the Mantissa is represented in 52 bits, the Exponent is represented in 11 bits which is biased to 1023 and the MSB of Double is reserved for sign bit. Multiplication of two floating point numbers represented in IEEE 754 format is done by multiplying the normalized 24 bit mantissa, adding the biased 8 bit exponent and resultant is converted in excess 127 bit format, for the sign calculation the input sign bits are XORed.

Technology, Greater Noida, India.

In this paper, we propose the Vedic Multiplication algorithm [Jagadguru Swami et al., 1965] for multiplication of 24 bit mantissa. The details of Vedic Multiplication with their advantages over the conventional multiplication method are discussed in the section III. The paper describes the implementation and design of IEEE 754 Floating Point Multiplier based on Vedic Multiplication Technique. Section II explores the basics of IEEE 754 floating point representation and implementation of floating point multiplier using Vedic multiplication technique. Section III describes the idea behind Vedic multiplication. Section IV comprises of result and conclusion.

FLOATING POINT MULTIPLICATION

The multiplier for the floating point numbers represented in IEEE 754 format can be divided in four different units:

Mantissa Calculation Unit
Exponent Calculation
Unit Sign Calculation
Unit Control Unit

The standard format for representation of floating point number is $(-1)^S 2^E (b_0 \cdot b_1 b_2 \dots b_p 1)$

The biased exponent $e = E + 127$, and the fraction $f = b_1 b_2 \dots b_p 1$.

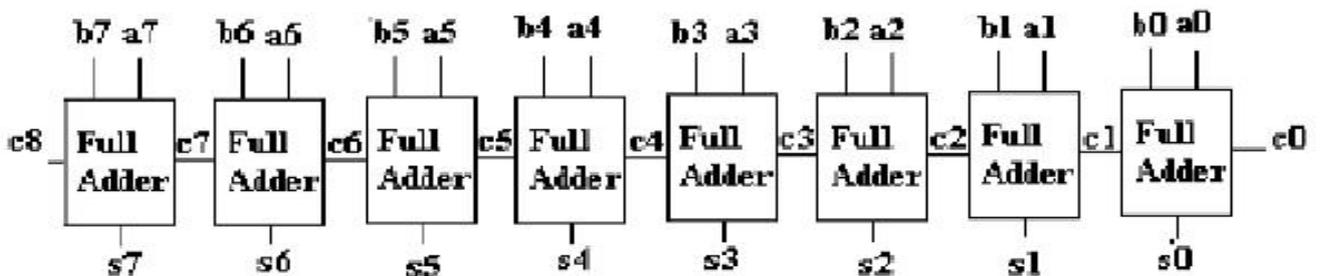

Figure 3. Eight BIT Ripple Carry Adder

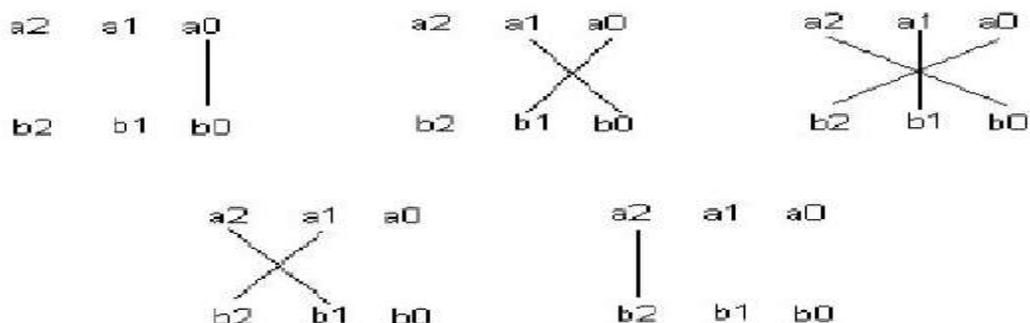

Figure 4. The Vedic Multiplication methods

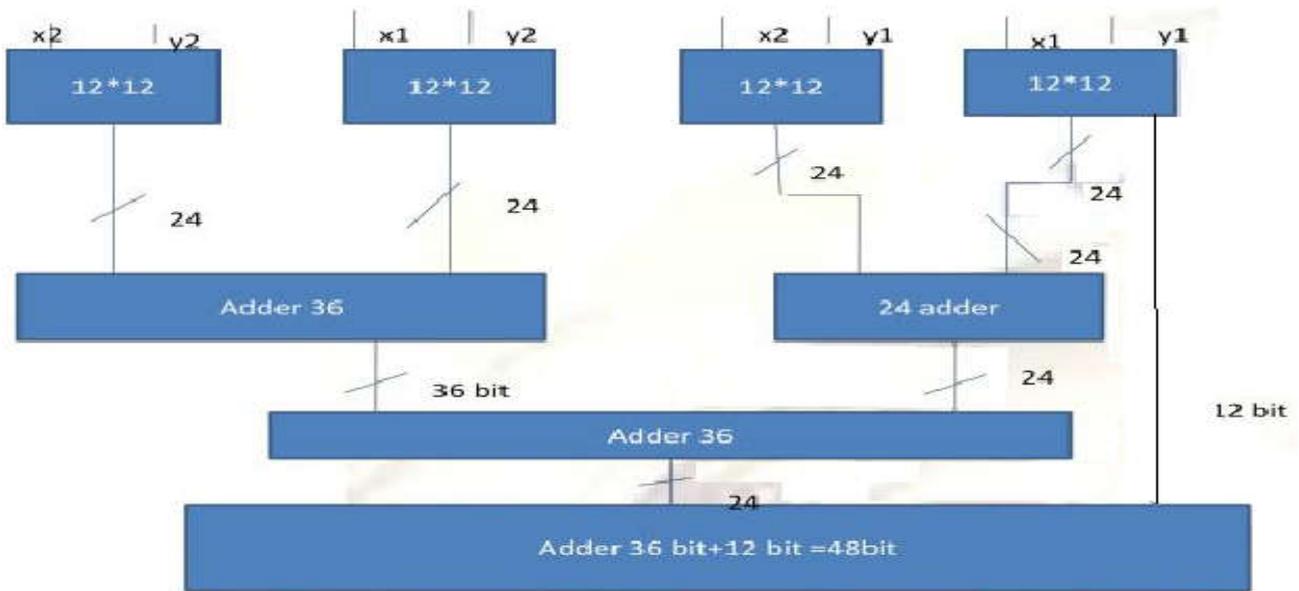

Fig. 5. Block diagram of 24x24 BIT Vedic multiplier

The Mantissa Calculation Unit requires a 24 bit multiplier if 32 bit single IEEE 754 format is considered [Metin Mete ÖZBLEN and Mustafa GÖK,]. In this paper we propose the efficient use of Vedic Multiplication Technique for this 24 bit multiplier. The Exponent Calculation Unit is implemented in this paper using 8 BIT Ripple Carry Adder. The advantages of ripple carry adder in addition to its implementation ease are low area and simple layout. The Control Unit raises the flag when NaN, Infinity, zero, underflow and overflow cases are detected. The control unit raises appropriate flag accordingly when the cases occurs. The various cases and its constituent flags are:

- If $e = 255$ and $f \neq 0$, then NaN
- If $e = 255$ and $f = 0$, then Infinity
- If $0 < e < 255$, then Number is $(-1)^s 2^e \cdot f$
- If $e = 0$ and $f \neq 0$, then $(-1)^s 2^{-126} \cdot f$ (demoralized numbers)
- If $e = 0$ and $f = 0$, then zero.

Figure 2 shows the proposed architecture for the Floating point multiplier. Consider the multiplication of two floating point numbers A and B, where $A = -19.0$ and $B = 9.5$. The normalized binary representation are $A = -1.0011 \times 2^4$ and $B = 1.0011 \times 2^3$. IEEE representations of operands are: Sign Exponent Mantissa

A = 1 1000011 001100000000000000000000
 B = 0 1000010 001100000000000000000000

Here, MSB of the 32 bit operand shows the sign bit, the exponents are expressed in excess 127 bit and the mantissa is represented in 23 bit. Sign of the result is calculated by XORing sign bits of both the operands A and B. In this case sign bit obtained after XORing is 1. Exponents of A and B are added to get the resultant exponent. Addition of exponent is done using 8 bit ripple carry adder Figure 3. After addition the result is again biased to excess 127 bit Code. For this purpose 127 is subtracted from the result. Two's complement subtraction using addition is incorporated for this purpose. If ER is the final resultant exponent then, $ER = EA + EB - 127$ where EA and

this case $ER = 10000110$. Mantissa multiplication is done using the 24 bit Vedic Multiplier. The mantissa is expressed in 23 bit which is normalized to 24 BIT by adding a 1 at MSB.

The normalized 24 bit mantissas are

100110000000000000000000100110000000000000000000

Multiplication of two, 24 bit mantissa is done using the Vedic Multiplier. In this case 48 bit result obtained after the multiplication of mantissa is

10110100100

Now setting up three intermediate results the final result (normalizing the mantissa by eliminating most significant 1) we obtained is: 1 10000110 011010010000000000000000 This result is deduced as

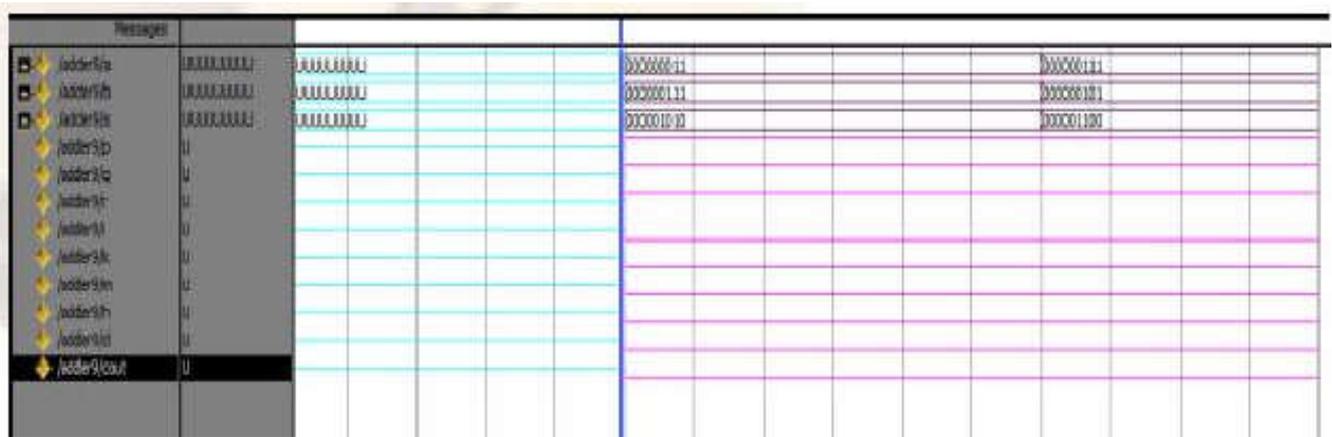

$$A \times B = -19.0 \times 9.5 = -180.5 = -1.01101001 \times 2^{134-127} = (-10110100.1) 2 = (-180.5) 10$$

MULTIPLIER DESIGN

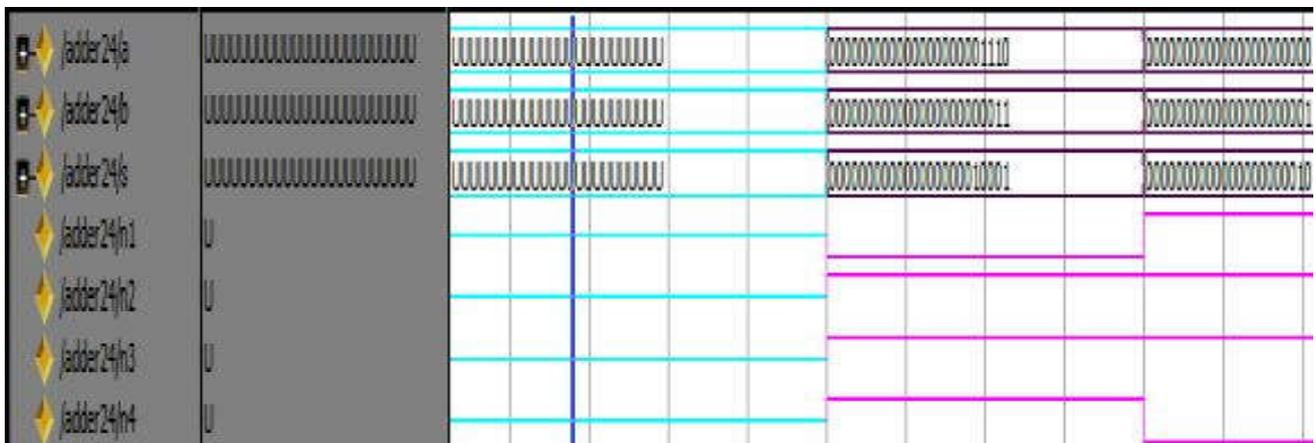

The performance of Mantissa calculation Unit dominates overall performance of the Floating Point Multiplier. This unit requires unsigned multiplier for multiplication of 24x24 BITs. The Vedic Multiplication technique is chosen for the implementation of this unit. This technique gives promising result in terms of speed and power [9]. The Vedic multiplication system is based on 16 Vedic sutras or aphorisms, which describes natural ways of solving a whole range of mathematical problems. Out of these 16 Vedic Sutras the Urdhva-triaykbyam sutra is suitable for this purpose. In this method the partial products are generated simultaneously which itself reduces delay and makes this method fast. The method for multiplication of two, 3 BITs number is shown Figure 4. Consider the numbers A and B where $A = a_2a_1a_0$ and $B = b_2b_1b_0$. The LSB of A is multiplied with the LSB of

SIMULATION RESULTS

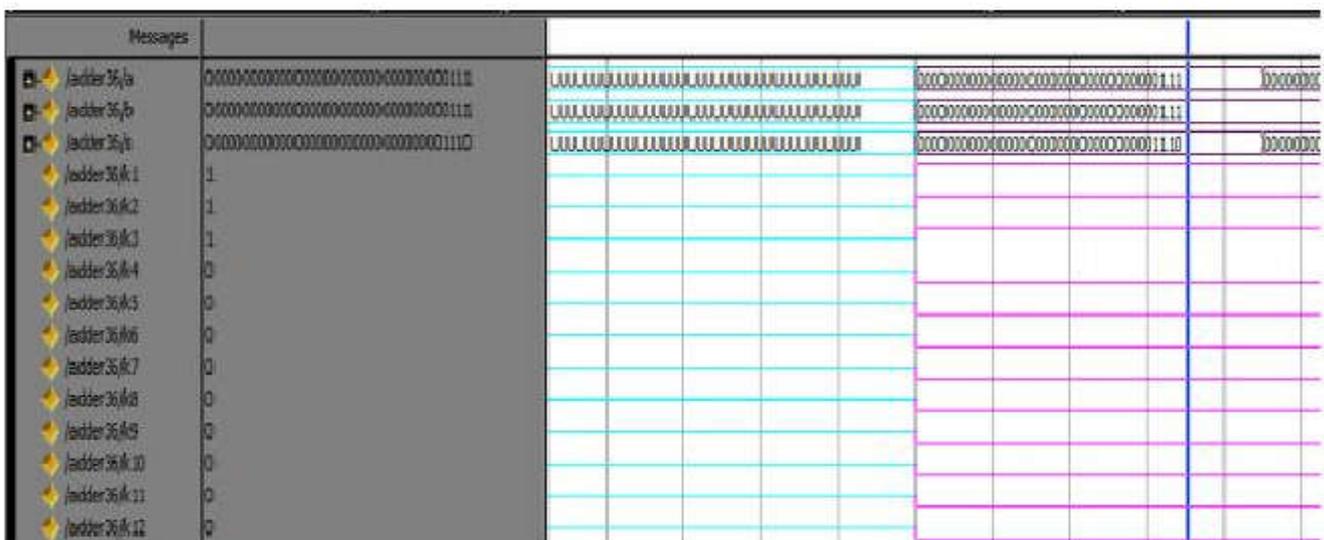

1. 9 bit Ripple carry adder

2. 24 bit Ripple carry adder

3. 36 bit Ripple carry adder

B: $s_0 = a_0b_0$;

$c_2s_2 = c_1 + a_2b_0 + a_1b_1 + a_0b_2$;

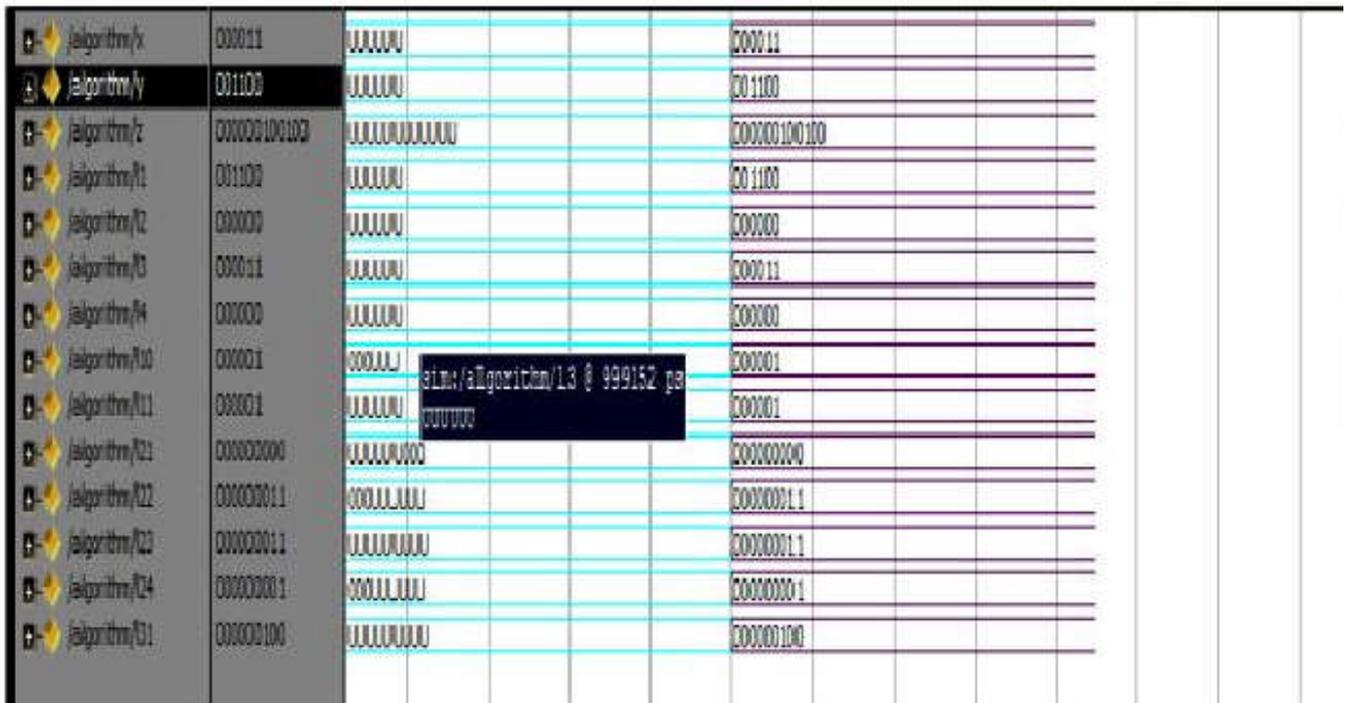

Then a_0 is multiplied with b_1 , and b_0 is multiplied with a_1 and the results are added together as: $c_1s_1 = a_1b_0 + a_0b_1$;

Next step is to add c_3 with the multiplication results of a_1 with b_2 and a_2 with b_1 .

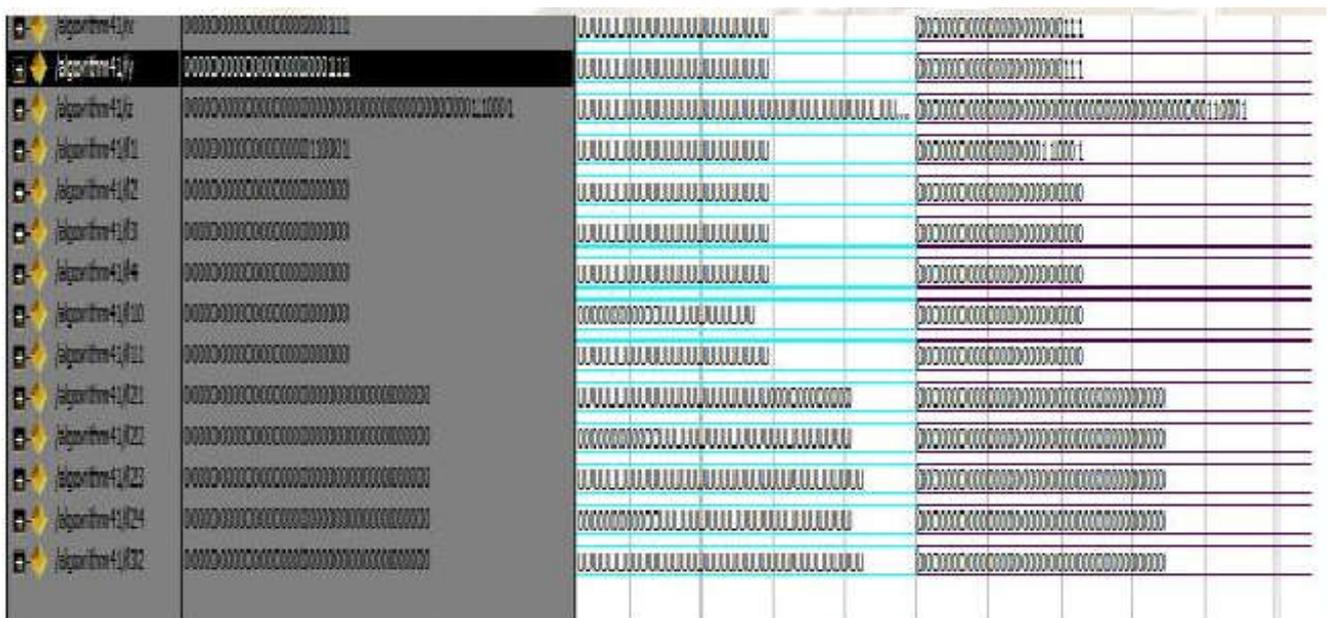

Here c_1 is carry and s_1 is sum. Next step is to add c_1 with the multiplication results of a_0 with b_2 , a_1 with b_1 and a_2 with b_0 .

$c_3s_3 = c_2 + a_1b_2 + a_2b_1$;

4. 3*3 Vedic multiplier

5. 24*24 Vedic multiplier

Similarly the last step

$$c4s4=c3+a2b2;$$

Now the final result of multiplication of A and B is $c4s4s3s2s1s0$.

The block diagram of 24x24 BIT multiplier is shown in Figure 5. This multiplier is modelled using structural style of modelling using VHDL. In this paper first a 3x3 Vedic multiplier is implemented using the above mentioned method. The 6x6 is designed using four 3x3 multipliers. After that the 12x12 is implemented using four 6x6 BIT multiplier.

Table 1. Comparisons of results

Parameters	This work	[10]
Device	vertex5	vertex2p
Power consumption	29.72mW	55mW
Time delay	5.246ns	3.070ns
Number of LUT'S	1032	1316
Number of I/O'S	99	100
Power delay product	155.92pJ	168.85pJ

Finally the 24x24 BIT multiplier is made using four 12x12 BIT multipliers. The 24x24 BIT multiplier requires four 12x12 BIT multipliers and two 24 BIT ripple carry adders and 36 BIT ripple carry adders.

A 24*24 Vedic multiplier is design by using four 12*12 Vedic multipliers based urdhva triyakbhyam.

Here first block 12X12 multiplier consists of lower 12 bits of x i.e. x(11 down to 0) and y(11 down to 0), second block 12*12 Vedic multiplier inputs are x(23 down to 12) and y(11 down to 0) out off 24 bit output of first block lower adder 12 bits are separated and higher order bits are appended as 12 lower bits in front augmented with "000000000000" now second block 24 bits and above 24 generate bits are added and 24 bits sum is generated using 24 bit ripple carry adder. Higher order 12 bit of y(23 down to 12) and lower order 12 bits of x i.e x(11 down to 0) are multiplier and appended in front with "000000000000" to make 36 data similarly both higher order 12 bits of x and y i.e x(23 down to 12) and y(23 down to 12) are multiplier and 36 bit data is formed by appending "000000000000". The above two 36 bits are added to generate a 36 bit data in the right side resultant 36 bits are added to generate final 36 bits the resultant of 24*24 multiplier is 48 bits consists of 36 higher bits from 36 bit adder output and lower order 12 bits 36+12=48 bits. The number of LUTs and slices required for the Vedic Multiplier is less and due to which the power consumption is reduced [9]. Also the repetitive and regular structure of the multiplier makes it easier to design. And the time required for computing multiplication is less than the other multiplication techniques. An Overflow or Underflow case occurs when the result Exponent is higher than the 8 BIT or lower than 8 BIT respectively. Overflow may occur during the addition of two Exponents which can be compensated at the time of subtracting the bias from the exponent result. When overflow occurs the overflow flag goes up. The under flow can occur after the subtraction of bias from the exponent, it is the case when the number goes below 0 and this situation can be handled by adding 1 at the time of normalization. When the underflow case occur the under flow flag goes high.

RESULTS AND CONCLUSION

The multiplier is designed in VHDL and simulated using Modelsim Simulator. The design was synthesized using Xilinx ISE 10.1 tool targeting the Xilinx Virtex 5 xc5vlx30-3-ff324 FPGA. A test bench is used to generate the stimulus and the multiplier operation is verified. The over flow and under flow flags are incorporated in the design in order to show the over flow and under flow cases. The paper shows the efficient use of Vedic multiplication method in order to multiply two floating point numbers. The lesser number of LUTs verifies that the hardware requirement is reduced, thereby reducing the power consumption. The power is reduced affectively still not compromising delay so much. The Table 1 shows the summary of the multiplier tested.
